

Plotting with Pandas Series and DataFrames

Pandas uses Matplotlib to generate figures. Once a figure is generated with Pandas, all of Matplotlib's functions can be used to modify the title, labels, legend, etc. In a Jupyter notebook, all plotting calls for a given plot should be in the same cell.

Setup

Import packages:

```
> import pandas as pd  
> import matplotlib.pyplot as plt
```

Execute this at IPython prompt to display figures in new windows:

```
> %matplotlib
```

Use this in Jupyter notebooks to display static images inline:

```
> %matplotlib inline
```

Use this in Jupyter notebooks to display zoomable images inline:

```
> %matplotlib notebook
```

Parts of a Figure

An Axes object is what we think of as a "plot". It has a title and two Axis objects that define data limits. Each Axis can have a label. There can be multiple Axes objects in a Figure.

Plotting with Pandas Objects

Series

a	
b	
c	

With a Series, Pandas plots values against the index:

```
> ax = s.plot()
```

When plotting the results of complex manipulations with **groupby**, it's often useful to **stack/unstack** the resulting DataFrame to fit the one-line-per-column assumption (see Data Structures cheatsheet).

Dataframe

	X	Y	Z
a			
b			
c			

With a DataFrame, Pandas creates one line per column:

```
> ax = df.plot()
```

Labels

Use Matplotlib to override or add annotations:

```
> ax.set_xlabel('Time')  
> ax.set_ylabel('Value')  
> ax.set_title('Experiment A')
```

Pass labels if you want to override the column names and set the legend location:

```
> ax.legend(labels, loc='best')
```

Useful Arguments to plot

	X	Y
a		
b		
c		

- **subplots=True**: one subplot per column, instead of one line
- **figsize**: set figure size, in inches
- **x** and **y**: plot one column against another

Ailurus fulgens

Kinds of Plots

```
df.plot(kind='scatter')
```

```
df.plot(kind='bar')
```

```
df.plot(kind='hist')
```

```
df.boxplot()
```
